Shadcn CLI

Learn how to use the new Shadcn CLI 3.0 with namespaced registries and private registry authentication for accessing pro blocks and components.

All of our blocks are compatible and downloadable using the official `**shadcn**` CLI.

We support the new namespaced registries and authentication. This feature provides improved **API key authentication** for our private shadcn registry, allowing you to access all our pro blocks and components directly from the CLI with environment variables. This enables seamless integration with MCP servers and other developer workflows.

Getting Started

1. Ensure your project has a components.json

```
npx shadcn@latest init
```

Read the official shadcn getting started guide for full installation instructions.

2. Generate Your API Key

Visit your dashboard and navigate to the **API Keys** section:

1. Click **"New API Key"**
2. Give your key a descriptive name (e.g., "Development", "CI/CD Pipeline")

3. Optionally set an expiration date
4. Copy the generated key

2. Configure Your Environment

Add your API key to your environment variables:

```
# .env
SHADCNBLOCKS_API_KEY=sk_live_your_api_key_here
```

3. Update components.json

Add the a **namespaced registry** configuration to your **`components.json`**:

```
{
  "$schema": "https://ui.shadcn.com/schema.json",
  "style": "default",
  "rsc": false,
  "tsx": true,
  "tailwind": {
    "config": "tailwind.config.ts",
    "css": "src/styles/globals.css",
    "baseColor": "neutral",
    "cssVariables": true
  },
  "aliases": {
    "components": "@/components",
    "utils": "@/lib/utils"
  },
  "registries": {
    "@shadcnblocks": {
      "url": "https://shadcnblocks.com/r/{name}",
      "headers": {
        "Authorization": "Bearer ${SHADCNBLOCKS_API_KEY}"
      }
    }
```

```
  }
}
```

4. Install Components

Use shadcn to install any block from our registry:

```
npx shadcn add @shadcnblocks/hero125
npx shadcn add @shadcnblocks/pricing3
npx shadcn add @shadcnblocks/features8
```

CLI Versions

CLI v3 (Recommended)

Uses the new registry format with scoped packages:

```
npx shadcn add @shadcnblocks/hero-1
```

Benefits:

- Faster installation
- Better dependency resolution
- Supports all component styles
- Namespaced registry support with authentication

CLI v2 (Legacy)

Uses URL-based installation:

```
npx shadcn add "https://shadcnblocks.com/r/hero-1"
```

Use this if you're on an older version of the shadcn CLI. Note that CLI v2 does not support namespaced registries or API key authentication.

Troubleshooting

Authentication Issues

❌ "Authentication required for pro blocks"

Possible causes:

- API key not set in environment variables
- Incorrect environment variable name
- API key doesn't start with `**sk_live_**`

Solutions:

1. Verify your API key is correctly set in environment variables
2. Check that the `**SHADCNBLOCKS_API_KEY**` variable name matches exactly
3. Ensure the key starts with `**sk_live_**`

❌ "Registry not configured"

Possible causes:

- Missing `**registries**` section in `**components.json**`
- Incorrect namespace configuration
- Missing URL template placeholder

Solutions:

1. Verify your `**components.json**` includes the `**registries**` section
2. Check that the namespace `**@shadcnblocks**` is defined
3. Ensure the URL template includes `**{name}**` placeholder

❌ "Invalid API key"

Possible causes:

- Expired API key
- Revoked API key
- Incomplete key format

Solutions:

1. Check if the key has expired in your dashboard
2. Verify the key hasn't been revoked
3. Ensure you're using the complete key (starts with `**sk_live_**`)

Component Issues

❌ "Component style doesn't match"

Ensure your `**components.json**` has the correct `**style**` value (e.g., `**radix-maia**` or `**base-maia**`):

```
{
  "style": "radix-maia"
}
```

❌ "Missing dependencies"

Run the CLI command again - it will install any missing dependencies:

```
npx shadcn add @shadcnblocks/hero-1
```

❌ "Radix vs Base UI conflict"

Ensure your `**components.json**` style uses the correct UI library prefix:

```
{
  "style": "radix-vega"  // Use radix- prefix for Radix UI
  // or
  "style": "base-vega"   // Use base- prefix for Base UI
}
```
